Two Decades of Polarization in American State Legislatures

Boris Shor^{*} and Nolan McCarty[†]

July 19, 2022

NPAT

Figure 1 shows the distribution of the number of NPAT survey responders within-state.

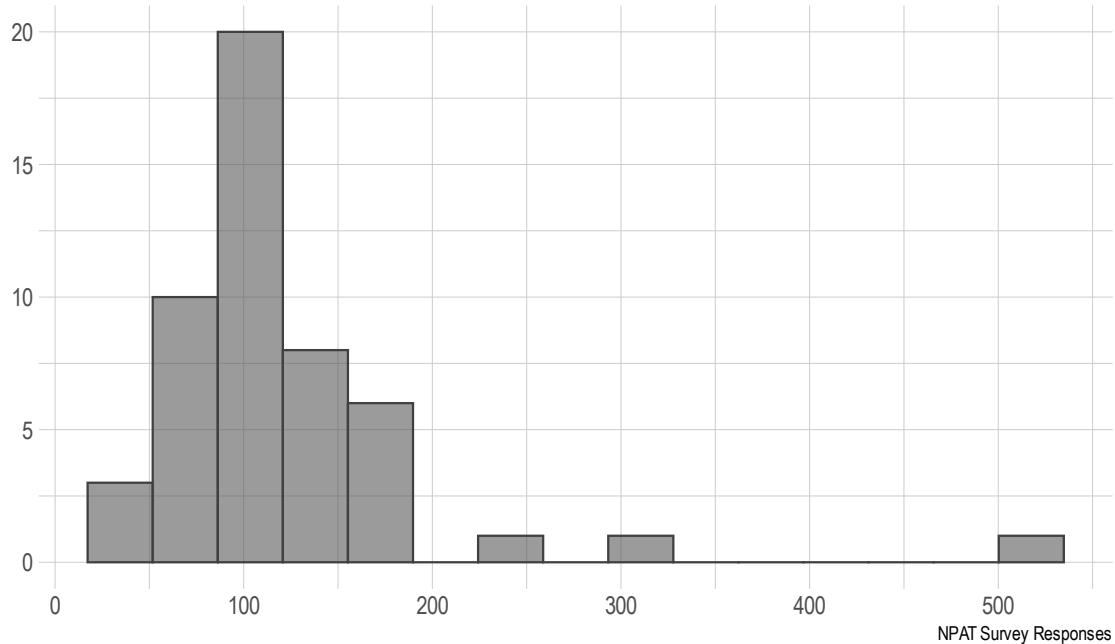

Figure 1: Counts of NPAT survey responses within states

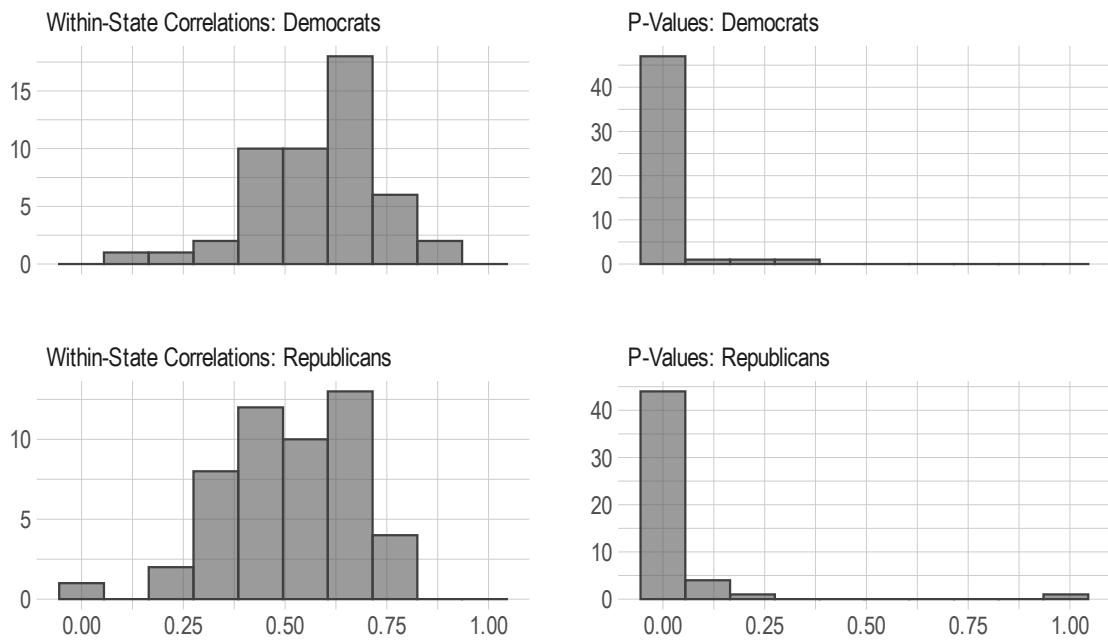

Figure 2: Within-state, within-party correlation between roll call-based ideal points and survey-only ideal points.

Figure 3 is a scatterplot of survey-only scores with within-state roll call based scores. The overall correlation is 0.77, and the within-party correlations range between 0.33 (Republicans) and 0.39 (Democrats). Figure 4 subdivides the data by region.

Figure 5 shows that within-party, within-state coefficients are uniformly positive. With two exceptions (Delaware at 0.06 and Rhode Island at 0.3), p-values are all essentially zero.

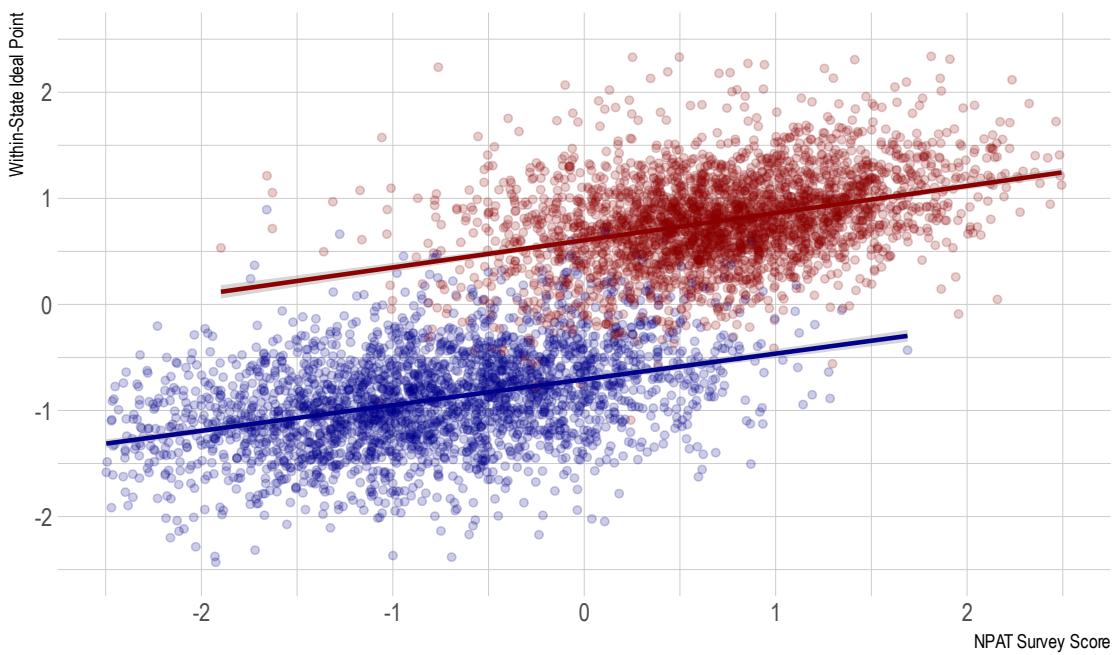

Figure 3: Scatterplot of NPAT survey scores and within-state scores

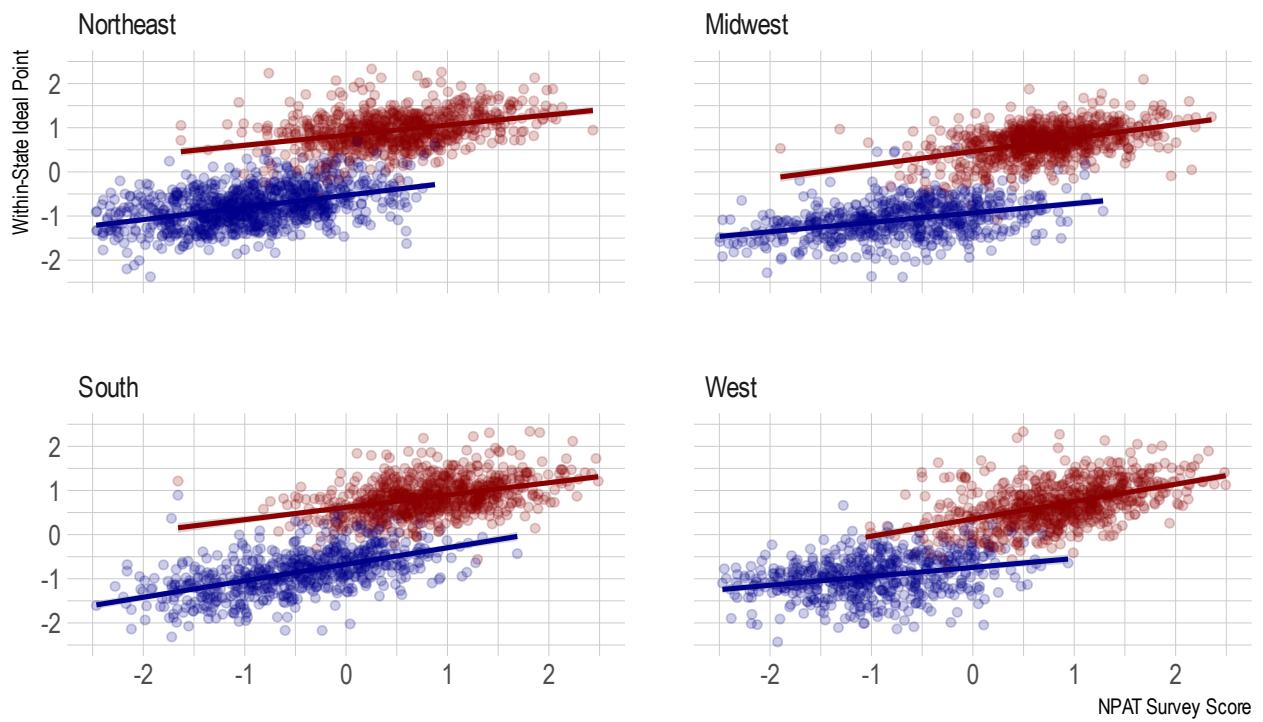

Figure 4: Scatterplot of NPAT survey scores and within-state scores, by region

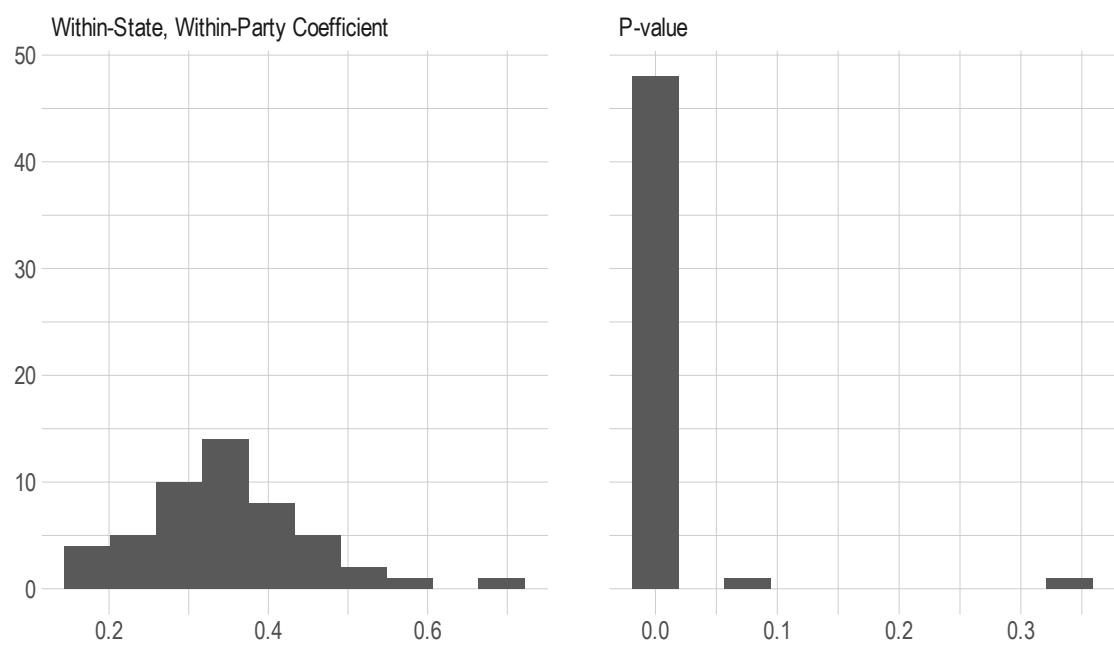

Figure 5: Coefficient and p -values from regressing NPAT scores on within-state ideal points.

Other Cross State Comparisons

Comparing across time, Figure 6.

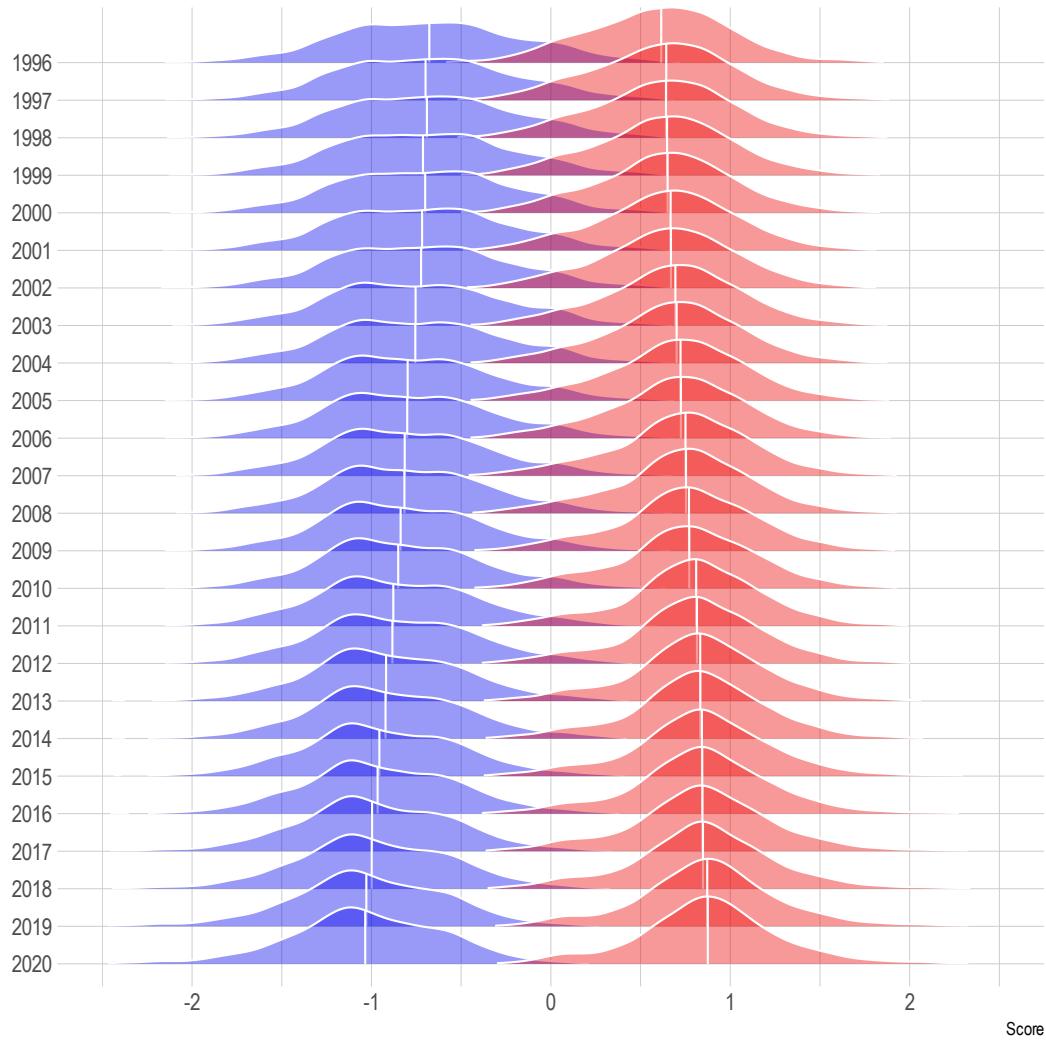

Figure 6: Legislator level ideal point densities, 1996-2020. Medians indicated by vertical line.

While we usually operationally measure polarization by differences in party *medians*, one might instead choose differences in party *means*. The latter might better capture the tails of the party ideology distributions which the median measure might miss. Figure 7 shows that mean differences are consistently higher than median differences.

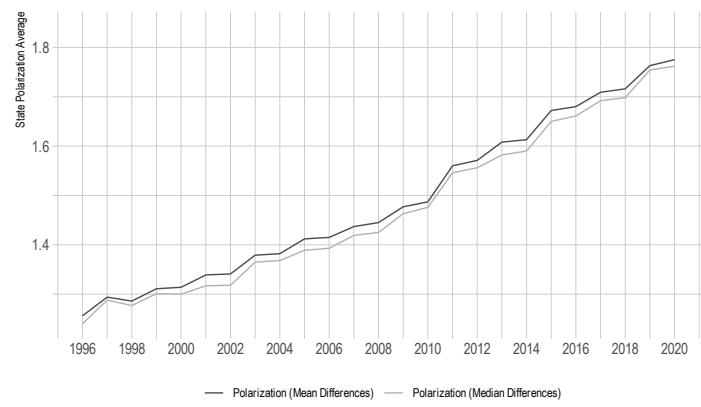

Figure 7: Trends in state legislative polarization over time, as measured by median and mean differences.

State Legislative Party Medians

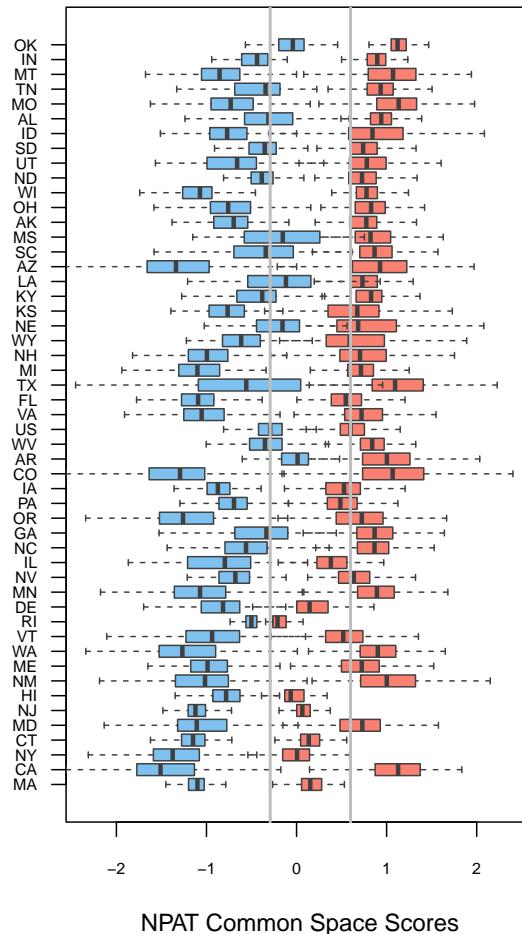

Figure 8: Boxplot of the distribution of ideology across and within states; states ranked by average ideology.

Polarization by Chambers

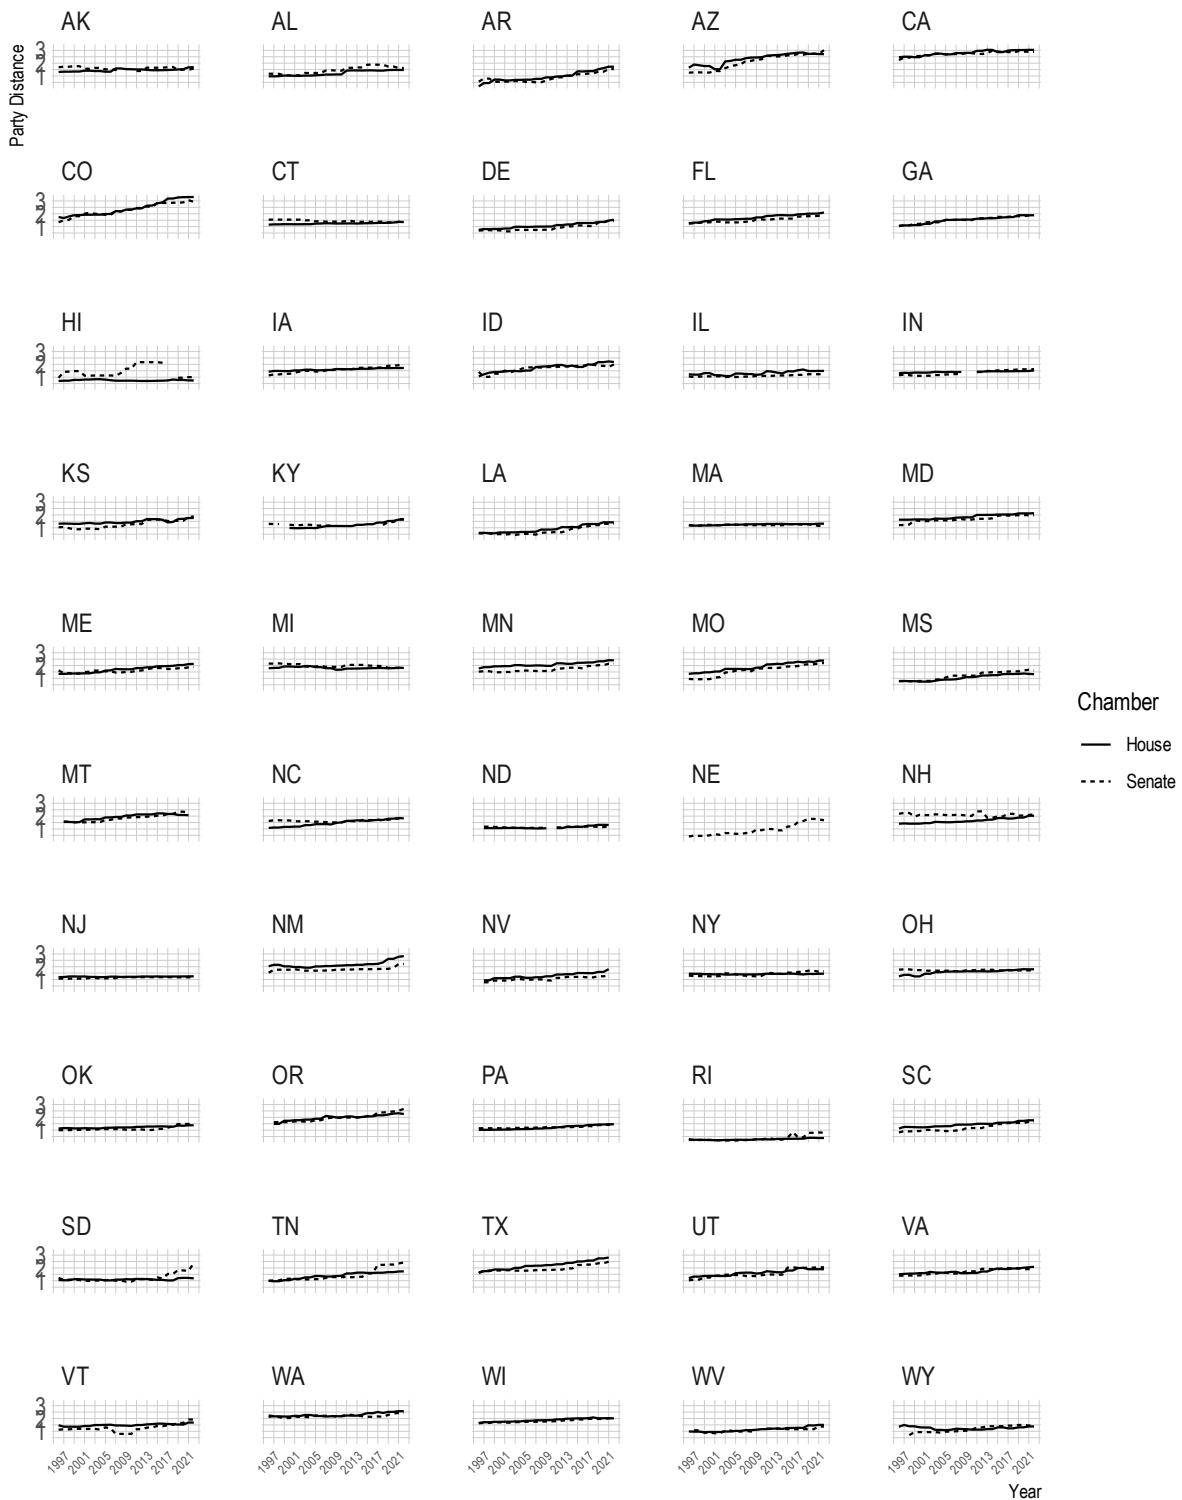

Figure 9: Difference in party medians. Higher values indicate more polarization.

Chamber Party Medians over Time
